Contents

riseset Overview

`riseset` is a collection of basic astronomical algorithms that compute the rise, transit, and set times of IAU-named stars.

`riseset` is distributed as an auxillary J addon. Auxillary addons are hosted in private GitHub repositories. `riseset` can be installed in the local J folder `~addons/jacks` with:

```
load 'pacman'

NB. files from https://github.com/bakerjd99/jackshacks
install 'github:bakerjd99/jackshacks'

NB. installed files
dir '~addons/jacks'
```

Once installed it can be loaded and run with:

```
load '~addons/jacks/riseset.ijs'
location_yellowstone 0

NB. IAU stars rising/setting over Old Faithful
fmt_today iau_today 0
```

For more details about setting up, running, and "hacking" `riseset` refer to the Jupyter notebook riseset_notebook.ipynb or the pdf version of same riseset_notebook.pdf. Both of these files are installed with `riseset`.

riseset Interface

```
fmt_today   [17]  format today verbs result
iau_today   [19]  named IAU stars rising/setting today
loadstars   [22]  loads riseset star data
nav_today   [30]  named navigation stars rising/setting today
navdaylist  [31]  sky safari 6_0 observing list of today's navigation stars
riseset     [40]  rise, transit, set times of stars
```

riseset Algorithm Notes

Many `riseset` algorithms are taken from Jean Meeus's book *Astronomical Algorithms*. A PDF copy of this book is available here:

https://ia802807.us.archive.org/20/items/astronomicalalgorithmsjeanmeeus1991/

also here:

https://www.amazon.com/s?i=stripbooks&rh=p_27%3AJean+Meeus&s=relevancerank&text=Jean+Meeus&ref=dp_byline_sr_book_1

Nutation algorithms are from Jay Tanner's site:

https://neoprogrammics.com/nutations/index.php

Markdown versions of Tanner's algorithms are stored in the JOD `futs` and `utils` dictionaries — see:

1. `nutation_in_longitude_dPsi_md`

2. `nutation_in_obliquity_of_ecliptic_dEpsDeg_md`

         April 6, 2023

in:

https://github.com/bakerjd99/joddumps/blob/master/futs.ijs

https://github.com/bakerjd99/joddumps/blob/master/utils.ijs

Delta T (ΔT) is computed using polynomial expressions by Espenak and Meeus, see:

https://eclipse.gsfc.nasa.gov/SEhelp/deltatpoly2004.html

A markdown version of the Delta T (ΔT) algorithm is in `futs` see:

1. `nasa_polynomial_expressions_for_delta_t_md`

You can display the markdown referenced about with the JOD expressions:

```
load 'general/jod'
od ;:'futs utils'
NB. display markdown documents
4 disp ; }.@(4&dnl)&.> 'nutation_';'nasa_'
```

Many examples showing how to use various `riseset` words are in the JOD `futs` test suite `riseset`. You can display all the test cases with the JOD expressions:

```
3 grp 'riseset'   NB. test cases in suite

3 disp 'riseset'  NB. display test suite

4 rtt 'riseset'   NB. run all tests in suite
```

riseset Source Code
